

Data sheet

Electric Regulating Valve

Type KVS

KVS is a series of electronic suction modulating valves for AC transport and refrigeration applications.

Accurate temperature or pressure control is obtained by modulating the refrigerant flow in the evaporator with a current or voltage driver.

With an EKC 368 controller (current driver) and an AKS sensor placed in the media to be controlled, an accuracy better than $\pm 0.5K$ can be obtained.

The balanced design provides bi-flow operation as well as solenoid shut-off function in both flow directions at MOPD 33 bar (478 psig).

Features

- Biflow.
- High resolution for precise control.
- Wide range for all common refrigerants R22, R134a, R404A, R407A, R407C, R407F, R422B, R422D, R438A, R448A, R449A, R450A, R452A, R507, R513A, R410A, R1234ze and other refrigerants
- Balanced port design (KVS 42).
- Solenoid tight shut-off.
- Low power consumption.
- Corrosion resistant design external as well as internal.
- Cable and connector assemblies as accessories.
- For manual operation and service of KVS valves an AST-g service driver is available. For further information please contact Danfoss (Commercial Refrigeration & Air Conditioning Controls).

	Actuator with integrated M12 with ceramic bearing (incl. metal gasket) for KVS 42	1	034G2087
	Metal Gasket	1	034G2344

Accessories:

M12 angle cable

M12 angle female connector is intended for use with a standard M12 male connector, available on stepper motor valves.

This cable is designed to offer high flexibility and small outer diameters with tensile strength. The angle way M12 cable consist of paired, twisted wires, which decreases mutual influence between signals transmitted along the cable and reduces influence of external sources of interference. The cables thus provides a higher degree of protection against lost steps compared to other cables.

Approvals

Specification

Jacket	PVC - black
Cable outer sheath	Oil - resistant
Water proof rating	IP 67
Operating temperature range	-40 – +80 °C
Wire type	Twisted pair, cross section 20 AWG / 0.5 mm ²
Cable outer diameter	7.0 mm
Minimum bending radius	10 x cable diameter
Cable combustibility / test	Flame retardant / VW-1 / CSA FT - 1
M12 standard	EN 61076-2-101
Reference standard	UL style 2464 and DIN VDE 0812
LVD directive	73/23/EEC and 93/68/EEC

	4	-	+	+	-	
	1	+	-	+	-	

If the controller driving the KVS valve is from another manufacturer than Danfoss or a custom design, the following points must be considered in order to overcome potential step loss.

a. To ensure total closing of the valve, the controller should have a function to overdrive the valve in the closing direction. It is recommended to overdrive ten percent of the full step range at appropriate intervals.

b. The amount of lost steps may increase as a function of the amount of changes of the opening degree. Such designed controller should be able to compensate the lost steps after a defined number of changes in opening degree.

Warning:
At power failure the KVS valve will remain in the opening position it has at the moment of power failure, unless a safety device in the form of a battery backup is installed.

Valve application

Valve operation

The KVS valves operate modulating by electronically controlled activation of the AST stepper motor. The motor is a type 2-phase bipolar, which stays in position, unless power pulses from a driver initiate the two discrete sets of motor stator windings for rotation in either directions.

The direction of the rotation of the spindle depends on the phase relationship of the power pulses. This is decisive for the travel of the piston.

The motor is operating the spindle, whose rotating movements are transformed into linear motion by the transmission in the cage assembly. The AST motor housing has an integrated M12 connector.

The KVS 42 valves have a pressure slide port respectively exponential cone, combining the best performance qualities at part load conditions as well as providing a zero-resistance at maximum capacity.

The piston design is fully power balanced, giving identical bi-flow performance capabilities and nearby identical maximum capacities.

Closing the valve by overdriving, ensures that the reference number in steps is always correct.

Operating the KVS series requires a controller with either 12 V dc voltage drive (5.5 W) or using chopper drive (100 mA RMS).

Danfoss EKC 368 in an example of a qualified controller.

Note:
Cable length between driver and actuator exceeding 10 m (30 feet) can set off self-induction with reduction in the transmitted power and irregularity in the sequences as consequence.

This may result in loss of steps now and again or more permanent inadequate power supply to the step motor.

The driver circuit as well as the cable specifications are part of this interference.

Please contact Danfoss for further information and possible countermeasures.

Coolselector2®

For easy and precise selection of valve, use Danfoss' CoolSelector2® software. You can find the KVS valves on the group, "Control and regulating valves". You can download it from <http://coolselector.danfoss.com>

Valve sizing

For optimum performance, it is important to take into consideration all system conditions and requirements. Selection is also dependent on an acceptable pressure drop across the valve. The following information will be needed when sizing a KVS valve:

- Refrigerant
- Evaporator capacity Q_e in kW or TR
- Evaporating temperature t_e in °C or °F
- Liquid temperature ahead of expansion valve t_l in °C or °F
- Max. acceptable pressure drop in the KVS valve in bar or psig
- Connection size

Valve selection Example

In valve selection it may be necessary to apply a correction factor to the actual evaporator capacity. This correction is required when system conditions are different than table conditions. Selection also depends on having an acceptable pressure drop across the valve. The following example illustrates correct sizing.

- Refrigerant: R 404A
- Evaporator capacity: $Q_e = 20 \text{ kW} / 5.7 \text{ TR}$
- Evaporating temperature: $t_e = -10^\circ\text{C} \sim 3.4 \text{ bar} / 14^\circ\text{F} \sim 49.3 \text{ psig}$
- Liquid temperature ahead of expansion valve: $t_l = 25^\circ\text{C} / 77^\circ\text{F}$
- Max. pressure drop in the valve: $\Delta p = 0.2 \text{ bar} / 2.9 \text{ psig}$
- Connection type: Solder
- Connection size: $1\frac{1}{8} \text{ in.}$

Step 1

Determine the correction factor for liquid temperature t_l ahead of expansion valve.

From the correction factors table (see below) a liquid temperature of $25^\circ\text{C} / 100^\circ\text{F}$, R404A corresponds to a factor of 1.0.

Correction factors for liquid temperature t_l

t_l °C	10	15	20	25	30	35	40	45	50
R134a	0.88	0.92	0.96	1.0	1.05	1.10	1.16	1.23	1.31
R22	0.90	0.93	0.96	1.0	1.05	1.10	1.13	1.18	1.24
R404A / R507	0.84	0.89	0.94	1.0	1.07	1.16	1.26	1.40	1.57
R407C	0.88	0.91	0.95	1.0	1.05	1.11	1.18	1.26	1.35

Step 2

Corrected evaporator capacity is $Q_e = 20 \times 1.0 = 20 \text{ kW} / 5.7 \times 1.0 = 5.7 \text{ TR}$

Step 3

Now select the appropriate capacity table, R404A, and choose the column for an evaporating temperature of $t_e = -10^\circ\text{C} / 14^\circ\text{F}$.

KVS 42 delivers $33.32 \text{ kW} / 9.5 \text{ TR}$ at a $0.2 \text{ bar} / 2.9 \text{ psig}$ pressure drop across the valve.

Using the corrected evaporator capacity, select a valve that provides an equivalent or greater capacity at an acceptable pressure drop across the valve of $0.2 \text{ bar} / 2.9 \text{ psig}$.

Based on the required connection size of $1\frac{1}{8} \text{ in.}$, the KVS 42 is the proper selection for this example.

* The valves in the capacity table refer to the evaporator capacity and based on liquid temperature t_i=30°C, superheat= sub cooling = 0 K.

* The conditions printed are the most common for the different refrigerants.

Other conditions can be calculated with Danfoss calculation software CoolSelector®

* The pressure drop across the valve is assumed to be the difference between evaporation pressure and suction pressure.

¹⁾ The capacity of vapour flow will not increase for pressure drops above the critical pressure drop.

* The valves in the capacity table refer to the evaporator capacity and based on liquid temperature t_e=86°F, superheat= sub cooling = 0 K.

* The conditions printed are the most common for the different refrigerants. Other conditions can be calculated with Danfoss calculation software CoolSelector®

* The pressure drop across the valve is assumed to be the difference between evaporation pressure and suction pressure.

1) The capacity of vapour flow will not increase for pressure drops above the critical pressure drop.
